

Traffic Management System

Built using Java

Done by: Aswanth.P
Reg. No: URK24CS7127

Introduction

This program is designed to streamline the monitoring and management of vehicular movement within a city or region. It leverages a MySQL database connected via JDBC (Java Database Connectivity) to store, retrieve, and manage critical information such as vehicle registrations, traffic signals, and traffic violations.

Scope of a Project

By integrating a database-driven approach with a user-friendly interface to provide an efficient and centralized platform for managing traffic-related information using Java and **MySQL**. The system's scope covers the registration and tracking of vehicles, maintenance of traffic signal data, and recording of violations committed by drivers. It supports essential **CRUD** operations—allowing authorized users to create, read, update, and delete records directly through a graphical interface.

Tools Used

- Visual Studio Code
- Java(JDK 8>) & SWING
- MySQL
- Database Connectivity(JDBC)

Conclusion

The Traffic Management System efficiently manages vehicle, signal, and violation records using Java and MySQL. It simplifies data handling through a user-friendly GUI and reliable database connectivity via JDBC. The system enhances accuracy, reduces manual work, and provides a scalable foundation for future traffic automation features and finally, the planned design and code was implemented and the project was completed and it executed successfully.
